## ABSTRACT

This paper contains the fifth part of the Catalog of Variable Stars created from the  $V$ -band photometric data collected by  $9^\circ \times 9^\circ$  camera of the All Sky Automated Survey. Preliminary list of variable stars found in the fields located between declination  $0^\circ$  and  $+28^\circ$  of the northern hemisphere is presented. 11,509 stars brighter than  $V=15$  were found to be variable (2,482 eclipsing, 1,397 regularly pulsating, 318 Mira and 7,310 other stars). Automated algorithm taking into account light curve properties (period, fourier coefficients) and other available data (2MASS colors, IRAS fluxes) was applied to roughly classify objects. Basic photometric properties are presented in the tables and thumbnail light curves are made available for reference. All the photometric data are available over the INTERNET at <http://www.astrouw.edu.pl/~gp/asas/asas.html> or <http://archive.princeton.edu/~asas>

**Key words:** *Catalogs – Stars: variables: general – Surveys*

## 1 Introduction

The All Sky Automated Survey (ASAS, Pojmański 1997) is a photometric CCD sky survey monitoring entire southern and part of the northern sky ( $\delta < 25^\circ$ ) since October 2000. It was triggered by ideas of Paczyński (1997) of using small automated instruments for bright star surveys.

The ASAS system (Pojmański 2001), located in Las Campanas Observatory (operated by the Carnegie Institution of Washington), consists of four instruments equipped with two wide field ( $9^\circ \times 9^\circ$ ,  $B$  and  $V$  filters), one very wide ( $36^\circ \times 36^\circ$ ,  $R$  filter) and one narrow field ( $2^\circ \times 2^\circ$ ,  $I$  filter) cameras, with  $2K \times 2K$  CCD attached. This configuration allows us to obtain photometry of all sources brighter than limiting magnitude  $V \sim 14$  ( $I \sim 13$ ).

Variability analysis was performed using the  $V$ -band data as soon as reasonable amount of data had been collected. We have already presented preliminary catalogs of variable stars in the Southern Hemisphere (Pojmański 2002, 2003, Pojmański and Maciejewski 2004, 2005) This paper contains the fifth part of the analyzed data - variable stars located in the fields located in the Northern Hemisphere ( $\delta < +28^\circ$ ).

## 2 Observations and Data Reduction

Data acquisition and processing in the ASAS system is fully automated, starting from taking calibration frames (BIAS, DARK, FLAT), scheduling observations and telescope

control, through image processing, photometry, astrometry, data transfer and backup, to incorporating new measurements into the ASAS Photometric Catalog.

The data reduction pipe-line used to process ASAS data was described in details by Pojmański (1997). We are making simultaneous photometry through five apertures (2 to 6 pixels in diameter). Each aperture data is processed separately. Data obtained with the smallest one is used for the faint ( $V > 12$ ) stars and with the largest one for the bright ( $V < 9$ ) objects. Profile fitting and image subtraction were tested as an alternative, but did not perform well with highly variable and undersampled ASAS images.

Astrometric calibration is currently based on the ACT (Urban *et al.* 1998) catalog. Typical positional accuracy is around 0.2 pixels ( $\sim 3$  arc sec).

The zero-point offset of photometry is based on the Tycho (Perryman *et al.* 1997) data and in most areas in the sky is accurate to about 0.05 mag. However, due to the non-perfect flat-fielding, missing color information and blending of the stars, much larger errors can be sometimes observed. Differential accuracy is much better, reaching 0.01 for bright stars.

### 3 Variability Search and Classification

Variability analysis was the same as the one used to complete previous parts of this catalog (Pojmański 2000). Only top 5 % of the stars showing large dispersion of measurements were analyzed. Light curves were tested for periodicity with the Analysis Of Variance test (Schwarzenberg-Czerny 1989). Non-periodic behavior was detected with dedicated long-term variability test. All detections were inspected and confirmed visually.

The automated classification algorithm, described in details in previous parts of this catalog (Pojmański 2002, 2003, 2004), consists of a few basic steps: First, 2MASS and IRAS counterparts are identified, providing  $J, H, K$  for all stars (with 10% ambiguity due to blending) and infrared fluxes for some of them. Strictly periodic variables are then classified into predefined classes using periods, amplitudes, Fourier coefficients of the light curves,  $H - K$  and  $J - H$  colors and infrared fluxes. Less periodic light curves and other unusual objects are simply assigned MISC type.

### 4 The Catalog

We have selected 11,509 variable stars in the equatorial zone of the Northern Hemisphere.

For each star the following data are provided: ASAS identification  $ID$  (coded from the star's  $\alpha_{2000}$  and  $\delta_{2000}$  in the form:  $hhmmss - ddm.m$ ), period  $P$  in days (or characteristic time scale of variation for irregular objects),  $T_0$  - epoch of minimum (for eclipsing) or maximum (for pulsating) brightness,  $V_{max}$  - brightness at maximum,  $\Delta V$  - amplitude of variation,  $Type$  - one of the predefined classes:  $DSCT$ ,  $RRC$ ,  $RRAB$ ,  $DCEP_{FU}$ ,  $DCEP_{FO}$ ,  $CW$ ,  $ACV$ ,  $BCEP$ ,  $M$  and  $MISC$ . GCVS cross-identification,  $J$ ,  $J - H$  and  $H - K$  data taken from 2MASS catalog are also provided.

Search for GCVS (Kholopov, *et al.* 1985) variables revealed about 2,402 possible matches within 3 arc minute radius.

Numbers of stars that have been primarily classified as a given type are listed in Table 1. Table 2. contains a compact version of the catalog. Only four columns are listed for each star: identification  $ID$ ,  $P$ ,  $V_{max}$ , and  $\Delta V$ . Column  $ID$  also contains some flags - ":" if classification was uncertain, "?" if multiple classes were assigned (objects were grouped in the table according to the highest rank assignment), "v" if GCVS data for this object exist.

Table 1

Number of various types of variable stars detected between declinations  $0^\circ$  and  $+28^\circ$  of the Northern Hemisphere by the ASAS-3 *V* camera.

Type	Count	Type	Count
<i>DCEP<sub>FU</sub></i>	136	<i>DSCT</i>	435
<i>DCEP<sub>FO</sub></i>	46	<i>EC</i>	1283
<i>CW</i>	172	<i>ED</i>	433
<i>ACV</i>	65	<i>ESD</i>	766
<i>BCEP</i>	15	<i>M</i>	318
<i>RRAB</i>	343	<i>MISC</i>	7310
<i>RRC</i>	185		

Appendix contains thumbnail plots of the light curves identified by their *ID*'s. For periodic variables phase in the range  $(-0.1 - 2.1)$  is plotted along the *x*-axis, while for Mira's and miscellaneous stars - HJD in the range  $(2451800-2453500)$ . Larger ticks on *y*-axis always mark 1 magnitude intervals and vertical span is never smaller than 1 mag.

The full catalog of variable stars observed by the ASAS system, containing more classification details, as well as complete data for the light curves, is available over the INTERNET:

<http://www.astroww.edu.pl/~gp/asas/asas.html>

or

<http://archive.pinceton.edu/~asas>

## 5 Conclusions

This paper, listing 11,509 objects in the Northern Hemisphere with declinations smaller than  $+28^\circ$  concludes preliminary search for variable stars in the All Sky Automated Survey photometric data, increasing the total number of variables detected by ASAS to almost 50,000.

Although containing much more uniform data than any other existing database, the ASAS catalog is still incomplete. Our future efforts will include repeating variability search in the first quarter of the Southern Hemisphere, incorporating narrow-eclipse binaries discovered by the ASAS Alert System (over 2,500 objects) and search for low-amplitude variables all over the sky. Test performed just in one of 500 fields revealed that including low-amplitude stars will double the size of the ASAS Catalog of Variable Stars.

## 6 Acknowledgments

This project was made possible by a generous gift from Mr. William Golden to Dr. Bohdan Paczyński, and funds from Princeton University. It is a great pleasure to thank Dr. B. Paczyński for his initiative, interest, valuable discussions, and the funding of this project.

I am indebted to the OGLE collaboration (Udalski, Kubiak, Szymański 1997) for the use of facilities of the Warsaw telescope at LCO, for their permanent support and maintenance of the ASAS instrumentation, and to The Observatories of the Carnegie Institution of Washington for providing the excellent site for the observations.

This research has made use of the SIMBAD database, operated at CDS, Strasbourg, France and of the NASA/ IPAC Infrared Science Archive, which is operated by the Jet

Propulsion Laboratory, California Institute of Technology, under contract with the National Aeronautics and Space Administration.

This publication makes use of data products from the Two Micron All Sky Survey, which is a joint project of the University of Massachusetts and the Infrared Processing and Analysis Center/California Institute of Technology, funded by the National Aeronautics and Space Administration and the National Science Foundation.

This work was supported by the KBN 2P03D02024 grant.

## Appendix

### ASAS Atlas of Variable Stars. Declinations $0^\circ - 28^\circ$ of the Northern Hemisphere

Only several light curves of each type are printed. Full Atlas is available over the INTERNET:

<http://www.astroww.edu.pl/~gp/asas/appendixeq.ps.gz>

#### Stars classified as EC

#### Stars classified as ESD

#### Stars classified as ED

#### Stars classified as DSCT

## Stars classified as BCEP

## Stars classified as ACV

## Stars classified as RRC

## Stars classified as RRAB

## Stars classified as DCEP-FU

Stars classified as DCEP-FO

Stars classified as CW

Stars classified as M

Stars classified as MISC
